Abstract

Disclosed are oligonucleotides probes which are useful for determining a sequence of nucleotides in a target polynucleotide. In one embodiment, the probe is of the formula: HO-(3')(B) $j$ (5')-OP(=O)(O-)NH-(B) $k$ -Bt\*, wherein B is a nucleotide or an analog thereof; j is in the range of from 1 to 12; k is in the range of from 0 to 12, such that the sum of j and k is less than or equal to 12; and Bt\* is a labeled chain-terminating moiety. In a second embodiment, the probe has a formula selected from the group consisting of: (1) OP(=O)(O-)O-(5')(B)sRRRR(B)wBt\*, and (2) OP(=O)(O-)O-(5')(B)sRRRR(B)w(3')OP(=O)(O-)O, wherein: B is a deoxyribonucleotide or an analog thereof; R is a ribonucleotide; s is in the range of from 1 to 8; w is in the range of from 0 to 8, such that the sum of j and k is less than or equal to 8; and Bt\* is a labeled chain-terminating moiety.
